VoltCap v0.6.66 — popup polish (update 444): after-fix evidence

Devices (USB): AYN Odin 2 Portal b92036fb (1920x1080, Android 13) · ARBOR GT78 BW0306N230000845 (960x640). Release build, installed in place.
Every capture: tools/qa/device/popfinal.sh with voltcap_test_nolaunch (no game can start) — home, open recording at +0.15/+0.3/+0.6 s, settled, +5 s, D-pad ▶▶ / ▼ / back, close at +0.25 s, after B, then rapid A B A B and A B B. Settings snapshot saved before and restored after.

Results

Twin desk hinge (D142)	**FIXED**	Light desk paper, picture + name strip on top, keys reserved, facts in whole rows; Odin + GT78, long title
Twin icons / showcase hinge	**GOOD**	Same layout fix in their dark hinge look; whole rows, no empty middle
Channel grid Row reveal (D142)	**FIXED**	Name, line and buttons in one action panel under the game, notch at it; D-pad, B, rapid OK
Case stacks Row reveal	**KEPT**	No room for a panel around the tall case: previous placement (checked, unchanged)
Rapid A/B on own windows (D143)	**FIXED**	A B A B lost the 2nd A and the last B opened categories (Odin). Now ends closed on the same game
Cinema captions	**FIXED**	12 sp on small screens (was 10 sp at 72 %)
Banner round keys	**FIXED**	The focused key names itself in a pill above it; header unchanged. Title line gap fixed
Shared move	**GOOD**	Long titles wrap, story pans, whole-screen shade from 443; no change needed
Wii Channel / Arctic / Cross own	**KEPT**	Not changed; re-recorded on both devices for regression
Disc station disc	**GOOD**	The real turn is kept and it already rests on its label side (+5 s still); D130 closed
Twin window, missing artwork	**NOT TESTED**	No game without any artwork on either device; placeholder path in code only
Thor	**NOT TESTED**	Not connected

Launch safety

GT78: no LAUNCH line in any run. Odin: one 'LAUNCH blocked' in run O2, caused by the QA script's own second A on Row reveal (script fixed);
the hook blocked it — no emulator started, no save touched. 'Last played: Today' on Donkey Konga 2 was already shown in the first capture (09:01), before any test this session (from update 439's D132).

D137 — GT78 Case stacks with the gameplay-video background

QA 'frames over 33 ms' counted LATENCY: on the GT78 every animated frame takes ~36 ms from its vsync (RenderThread issue ~15 ms) on ANY layout and background — yet a new frame still arrives every 16.7 ms. New metric (QaTrace 'cadence'): vsyncs with no new frame while drawing = what you see.

Case stacks, 6 steps 0.8 s apart, 3 runs each (d137.sh, no screenrecord, no gfxinfo reset)

Clip playing (owner's background)	**INFO**	missed vsyncs 6 / 6 / 6 per run (~360 frames) — idle 0 / 0 / 2
Clips off (voltcap_test_novideo)	**INFO**	missed vsyncs 5 / 7 / 5 per run (~360-420 frames) — idle 0 / 0 / 0
Where the missed frame is	**INFO**	the first frame of each step: UI thread composition 15-20 ms + recording 15 ms
Stage in one cached layer	**INFO**	no change (298 vs 303 slow frames idle, same cadence) — reverted

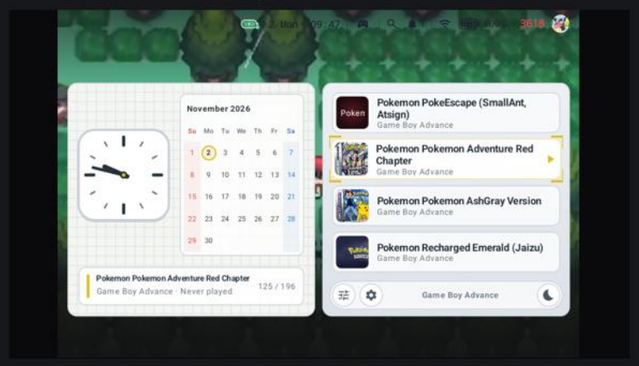

Conclusion

The gameplay video adds no dropped frames and was not paused or disabled. What remains is ~1 dropped frame per step on the GT78, from the whole home screen recomposing when the focused game changes (LauncherScreen reads the focus at the top). Splitting those reads is a refactor of the 220 KB home screen — not attempted for the RC. D137 stays open, severity lowered to low.
